## UNIT. NO 10

## ACIDS, BASES AND SALTS

## Arrhenius concept of Acids and Bases:

In 1887 a Swedish chemist Arrhenius proposed an acid, base theory. According to this theory. "An acid is a substance that ionizes in water to produce $\mathbf{H}^{+}$ions and a base is a substance that ionizes in water to produce $\mathrm{OH}^{-}$ions".

Examples of Acid:
$\mathbf{H C l}_{(\mathrm{g})} \stackrel{\mathrm{H}_{\mathbf{2}}^{\mathrm{O}}}{\rightleftharpoons} \mathbf{H}_{(a q)}^{+}+\mathrm{Cl}_{(a q)}^{-}$
In above reaction HCl is an acid because it gives $\mathrm{H}^{+}$ions when dissolve in water.

## Examples of Base:

$\mathrm{NaOH} \stackrel{\mathrm{H}_{2} \mathrm{O}}{\rightleftharpoons} \mathrm{Na}^{+}+\mathrm{OH}^{-}$
In above reaction NaOH is a base because it produce $\mathrm{OH}^{-}$ions when dissolve in water.

## Question:

According to Arrhensius concept which substances in the following reaction are acids or bases.

1. $\mathrm{HNO}_{3}$

$$
\stackrel{\mathbf{H}_{\mathbf{2}}{ }^{\mathbf{2}}}{\rightleftharpoons} \mathbf{H}^{+}+\mathbf{N O}^{-3}
$$

Sol:
In above reaction $\mathrm{HNO}_{3}$ produces $\mathrm{H}^{+}$ions so $\mathrm{HNO}_{3}$ is an acid.
2. $\mathrm{H}_{2} \mathrm{SO}_{4}$

$$
\stackrel{\mathbf{H}_{2} \mathrm{O}}{\rightleftharpoons} \mathbf{2 H}^{+}+\mathbf{S O}_{4}^{-2}
$$

Sol:
In above reaction $\mathrm{H}_{2} \mathrm{SO}_{4}$ produces $\mathrm{H}^{+}$ions so it is an acid.
3. $\mathbf{K O H} \stackrel{\mathbf{H}_{2} \mathbf{0}}{\rightleftharpoons} \mathrm{~K}^{+}+\mathbf{O H}^{-}$

Sol:
In above reaction KOH produces $\mathrm{OH}^{-}$ions so it is a base.

# CANTT ACADEMY 

4. $\mathbf{N H}_{\mathbf{4}} \mathbf{O H} \stackrel{\mathrm{H}_{2} \mathbf{O}}{\rightleftharpoons} \mathbf{N H}_{\mathbf{4}}^{+}+\mathbf{O H}^{-}$

## Sol:

In above reaction $\mathrm{NH}_{4} \mathrm{OH}$ produces $\mathrm{OH}^{-}$ions so it is a base.

## The Bronsted-Lowery concept of Acids and Bases:

In 1923 J.N Bronsted and T.M Lowery proposed an acid base theory and it is known as Bronsted-Lowery theory. According to this theory. "An acid is a proton donor and a base is a proton acceptor".

## Example-1:

$$
\mathrm{HCl}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{Cl}^{-}
$$

In above reaction HCl is converted in $\mathrm{Cl}^{-}$ion. Therefore HCl donates a proton so according to Lowery- Bronsted theory HCl is an acid.

In the above reaction $\mathrm{H}_{2} \mathrm{O}$ is converted into $\mathrm{H}_{3} \mathrm{O}^{+}$ions. Therefore $\mathrm{H}_{2} \mathrm{O}$ accepts (gains) a proton. So according to Bronsted - Lowery theory $\mathrm{H}_{2} \mathrm{O}$ is a base.

## Example-2:

$$
\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{NH}_{4}^{+}+\mathrm{OH}^{-}
$$

In above reaction $\mathbf{N H}_{\mathbf{3}}$ is converted into $\mathrm{NH}_{4}^{+}$ion. Therefore $\mathbf{N H}_{\mathbf{3}}$ accepts (gains) a proton so according to Bronsted - Lowery theory $\mathbf{N H}_{\mathbf{3}}$ is a base.

In the above reaction $\mathrm{H}_{2} \mathrm{O}$ is converted into $\mathrm{OH}^{-}$ions. Therefore $\mathrm{H}_{2} \mathrm{O}$ donates a proton so according to Bronsted - Lowery theory $\mathrm{H}_{2} \mathrm{O}$ is an acid.

## Lewis concept of Acids and Bases:

In 1923 G.N Lewis presented an acid base theory. According to this theory. "An acid is a substance that can accept a pair of electrons to form a coordinate covalent bond

# CANTT ACADEMY <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Gell: 0321-5138288 <br> <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288 

 <br> <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288}
and base is a substance that can donate a pair of electrons to form a coordinate covalent bond".

## Example of Lewis Acid:

In $\mathrm{BF}_{3}$ Boron has six electrons (3 electron pairs) so it needs two more electrons to complete its octet. $\mathrm{So}_{\mathrm{BF}}^{3} 3$ is an electrons pair acceptor. Hence according to Lewis concept $\mathrm{BF}_{3}$ is Lewis acid.

## Example of Lewis Base:

$$
\mathrm{NH}_{3}=\mathrm{H} \quad \bullet \times \mathrm{N} \stackrel{\bullet}{ } \mathrm{H}_{x}
$$

In $\mathrm{NH}_{3}$ nitrogen has free lone pair therefore it can donate an electron pair. Hence according to Lewis concept $\mathrm{NH}_{3}$ is Lewis base.

Some characteristics properties of acids and bases:

| Sr.No | Property | Acid | Base |
| :---: | :--- | :--- | :--- |
| $\mathbf{1}$ | Taste | Sour | Bitter |
| $\mathbf{2}$ | Effect on blue litmus | Turns red | No effect |
| $\mathbf{3}$ | Effect on red litmus | No effect | Turns blue |
| $\mathbf{4}$ | Effect on skin | Corrosive | Harm skin tissue |
| $\mathbf{5}$ | Electrical conductivity | Aqueous solutions conduct <br> electricity | Aqueous solutions conduct <br> electricity |

## Question:

Write names, formula and use of some common acids?

| Sr.No | Name | Formula | Common use |
| :---: | :--- | :--- | :--- |
| $\mathbf{1}$ | Hydrochloric acid | HCl | Cleaning of metals, bricks and removing scale from boilers. |
| $\mathbf{2}$ | Nitric acid | $\mathrm{HNO}_{3}$ | Manfacture of fertilizers, explosives |

|  |  |  |  |
| :---: | :--- | :--- | :--- |
| $\mathbf{3}$ | Sulphuric acid | $\mathrm{H}_{2} \mathrm{SO}_{4}$ | Manufacture of many chemicals, drugs, dyes, paints \& explosive |
| $\mathbf{4}$ | Phosphoric acid | $\mathrm{H}_{3} \mathrm{PO}_{4}$ | Manufacture of fertilizers, acidulant for food |

$\qquad$

## Question:

Write names, formula and use of some common bases?

| Sr.No | Name | Formula | Common use |
| :---: | :--- | :--- | :--- |
| $\mathbf{1}$ | Sodium Hydroxide | NaOH | Soap making, drain cleaners |
| $\mathbf{2}$ | Potassium Hydroxide | KOH | Making liquid soap, shaving cream |
| $\mathbf{3}$ | Calcium Hydroxide | $\mathrm{Ca}(\mathrm{OH})_{2}$ | Making mortar, plasters, cement |
| $\mathbf{4}$ | Magnesium Hydroxide | $\mathrm{Mg}(\mathrm{OH})_{2}$ | Antacid, Laxative |

$\qquad$

## Question:

## Write the main factors that causes certain diseases in smokers.

Ans. Sulphuric dioxide and oxides of nitrogen are also produced by the smoking of cigarettes. Smokers breath in a lot of sulphur dioxide. Over long period of time, they have an increased risk of suffering from cold, bronchitis and asthma.

## Acid Rain \& Acid Snow:

## Causes of Acid Rain \& Acid Snow;

Fossils fuels contain small amount of sulphur and nitrogen. Fossils fuels produce sulphur dioxide and oxides of nitrogen when the fuel is burn. Large amount of these oxides are released from burning of coal in factories and power stations. These oxides chemically react with water vapours in clouds and oxygen in air forming.

Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Gell: 0321-5138288

$$
\begin{array}{ll}
\mathrm{SO}_{2}+\frac{1}{2} \mathrm{O}_{2}+\mathrm{H}_{2} \mathrm{O} & \longrightarrow \mathrm{H}_{2} \mathrm{SO}_{4} \text { (Acid) } \\
4 \mathrm{NO}_{2}+\mathrm{O}_{2}+2 \mathrm{H}_{2} \mathrm{O} \longrightarrow 4 \mathrm{HNO}_{3} \text { (Acid) }
\end{array}
$$

These acids mix up with rain drops and fall as acid rain or acid snow.

## Question:

## Write some effects (disadvantages) of acid rain?

Ans. Acid rain can damage trees and it kills huge areas of forest. If washes out aluminium ions from the soil. These aluminium ions run into rivers, lakes and ponds. Aluminium is very toxic to fish and other aquatic life. Therefore fish and other aquatic animals cannot survive and they may be killed.

Acid rain can also damage buildings and statues. The acid rain react with carbonates present in the stones of buildings and damage the buildings. The acid rain also dissolves in the statues as a result the statue crumbles away. The acid rain is an important environmental issue.

## Self Ionization of Water:

Water molecules are highly polar in nature. Sometimes the collision $\mathrm{b} / \mathrm{w}$ water molecules becomes strong enough that a proton is transferred from one water molecule to another water molecule. This process is called self ionization of water.

## Hydroxide Ion:

A water molecule that denotes or loses a proton becomes a negatively charged ion. This negatively charged ion is called hydroxide ion. It is represented by " $\mathrm{OH}^{-}$".

$$
\mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}
$$

(Hydroxide Ion)

## Hydronium Ion:

A water molecule that accepts or gain a proton becomes positively charged ion. This positively charged ion is called hydronium ion. It is represent by " $\mathrm{H}_{3} \mathrm{O}$ ".

$$
\mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \quad \underset{\text { (Hydronium Ion) }}{\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}}
$$

## Self Ionization:

Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288

The reaction in which two water molecule produce ions is called self ionization or auto ionization of water. This reaction can also be written as simple ionization of water.

$$
\mathrm{H}_{2} \mathrm{O} \quad \longrightarrow \mathrm{H}^{+}+\mathrm{OH}^{-}
$$

Water is a weak electrolyte. Therefore the self ionization of water occurs to a very small extent. At $25^{\circ} \mathrm{C}$ temperature the concentration of $\mathrm{H}^{+}$ions and $O H^{-}$ions are given as:

$$
\left[H^{+}\right]=\left[O H^{-}\right]=1 \times 10^{-7} M
$$

## Equilibrium Constant For Self Ionization of Water:

$$
\mathrm{H}_{2} \mathrm{O} \quad \longrightarrow \mathrm{H}^{+}+\mathrm{OH}^{-}
$$

We know equilibrium constant expression is

$$
\begin{aligned}
\text { Equilibrium constant } & =\frac{\text { Product of concentration of products }}{\text { Product of concentration of reactants }} \\
\mathbf{K c} & =\left[\mathbf{H}^{+}\right]\left[\mathbf{O H}^{-}\right] \\
\mathbf{K c}\left[\mathbf{H}_{\mathbf{2}} \mathbf{O}\right] & =\left[\mathbf{H}_{\mathbf{2}} \mathbf{O}\right]\left[\mathbf{H H}^{-}\right]
\end{aligned}
$$

Since water is a weak electrolyte. Therefore the concentration of $\mathbf{H}_{2} \mathbf{O}$ will remain the same
So

$$
\mathbf{K c}\left[\mathbf{H}_{2} \mathrm{O}\right]=\mathbf{K w}
$$

Where "Kw" is called ionization constant for water.

$$
\mathbf{K w}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]
$$

At $25^{\circ} \mathrm{C}$ temperature

$$
\begin{aligned}
\mathrm{Kw} & =\left[1 \times 10^{-7}\right]\left[1 \times 10^{-7}\right] \\
\mathrm{Kw} & =1 \times 10^{-7-7} \\
K w & =1 \times 10^{-14}
\end{aligned}
$$

## Q. Write a note on pH scale?

Ans. In 1909 the Danish biochemist Soren Sorenson proposed a convenient method to express a small concentration of $\mathrm{H}^{+}$ions and $\mathrm{OH}^{-}$ions by pH or pOH .

## PH:

The negative logarithm of the molar concentration of $\mathrm{H}^{+}$ions in aqueous solutions is called pH .

$$
p H=-\log \left[H^{+}\right]
$$

For pure water at $25^{\circ} \mathrm{C}$

$$
\begin{aligned}
{\left[H^{+}\right] } & =1 \times 10^{-7} M \quad \text { put in }(i) \\
p H & =-\log \left[H^{+}\right] \\
& =-\log \left[1 \times 10^{-7}\right] \\
& =-\log \left[10^{-7}\right]
\end{aligned}
$$

# CANTT ACADEMY <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288 

$$
\begin{aligned}
= & -(-7) \log 10 \\
p H & =+7(1) \\
p H & =7
\end{aligned}
$$

The above result shows that pH of pure water is 7 . Therefore all aqueous solutions with $\mathrm{pH}=7$ at $25^{\circ} \mathrm{C}$ are called neutral solution.

## Acidic Solution:

All such solutions whose pH is less than 7 are called acidic solution.

## Basic Solution:

All such solutions whose pH is greater than 7 are called basic solutions.

## POH:

The negative logarithm of the molar concentration of $\mathrm{OH}^{-}$ions in aqueous solutions is called POH.

$$
p H=-\log \left[O H^{-}\right] \quad \text { put in }(i)
$$

For pure water at $25^{\circ} \mathrm{C}$

$$
\begin{aligned}
{\left[O H^{-}\right] } & =1 \times 10^{-7} \mathrm{M} \quad \text { Put in }(i) \\
p O H & =-\log \left[O H^{-}\right] \\
& =-\log \left[1 \times 10^{-7}\right] \\
& =-\log \left[10^{-7}\right] \\
p O H & =-(-7) \log 10 \\
p O H & =+7(1) \\
p O H & =7
\end{aligned}
$$

Prove that $\mathbf{p H}+\mathbf{p O H}=14$

## Solution:

L.H.S $=\mathrm{pH}+\mathrm{pOH}$

$$
\begin{align*}
&=\left(-\log \left[\mathrm{H}^{+}\right]\right)+\left(-\log \left[\mathrm{OH}^{-}\right]\right)  \tag{i}\\
& \text {At } 25^{\circ} \mathrm{C} \\
& {\left[\mathrm{H}^{+}\right] \quad }=1 \times 10^{-7} \mathrm{M} \\
& {\left[\mathrm{OH}^{-}\right] }=1 \times 10^{-7} \mathrm{M}
\end{align*}
$$

Putting values in

$$
\begin{align*}
\mathrm{pH}+\mathrm{pOH} & =\left(-\log \left[\mathrm{H}^{+}\right]\right)+\left(-\log \left[\mathrm{OH}^{-}\right]\right)  \tag{i}\\
& =\left(-\log \left(1 \times 10^{-7}\right)\right)+\left(-\log \left(1 \times 10^{-7}\right)\right) \\
& =\left(-\log 10^{-7}\right)+\left(-\log 10^{-7}\right) \\
& =(-(-7) \log 10)+(-(-7) \log 10) \\
& =7 \log 10+7 \log 10 \\
& =7(1)+7(1) \\
& =7+7 \\
& =14=\text { R.H.S }
\end{align*}
$$

## Question:

## What is the importance of Kw (Ionization constant for water).

Ans. Kw is used to indicate the acidic solution, basic solution and neutral solution. It depends upon temperature. In any aqueous solution at $25^{\circ} \mathrm{C}$ temperature the product of concentration of $\mathrm{H}^{+}$ions and $\mathrm{OH}^{-}$ions is always equal to $1 \times 10^{-14}$. It means that if [ $\mathrm{H}^{+}$] increases then [ $\mathrm{OH}^{-}$] decreases in such away that their product always remain $1 \times 10^{-14}$.

For neutral solution $\quad\left[H^{+}\right]=\left[\mathrm{OH}^{-}\right]=1 \times 10^{-7}$
For acidic solution $\left[H^{+}\right]>1 \times 10^{-7}$
For basic solution $\quad\left[\mathrm{OH}^{-}\right]<1 \times 10^{-7}$

## The pH Scale:

# CANTT ACADENY <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288 

Chemists used a number scale from 0 to 14 to describe the concentration of $\mathrm{H}^{+}$ions in a solution. This number scale is known as pH scale. pH scale help us to indicate a neutral solution, acidic solution or basic solution.

1. A pH of 7 indicates a neutral solution.
2. A pH of less than 7 indicates an acidic solution.
3. A pH of greater than 7 indicates a basic solution.

## Measurement of pH:

Scientists used different methods to measure pH of a solution. Normally pH paper or universal indicator paper is used to measure pH of a solution. This pH paper is dipped in the solution after sometime some colour appears on the pH paper. This colour is compared to the colour chart. From colour chart we get the exact pH value.

## Use for Litmus Paper:

A very common method used in chemistry to find the pH value of acids or basis in the use of litmus paper. In this method the litmus paper may be red or blue. The colour red or blue is of special importance because an acid turns blue litmus paper red and a base turns red litmus paper blue.

## Q. What is acidity of stomach?

Ans. The main component of digestive or gastric juice in the stomach is hydrochloric acid. Almost two liter of this acid is secreted each day by gastric glands. Sometimes too much acid is secreted in the stomach which causes indigestion. This is called acidity of the stomach.

## Q. Write some valuable applications of $\mathbf{p H}$ measurement.

Ans. Analytical chemist measures pH value of solutions. pH measurement has valuable applications.

1. It helps to create soil conditions ideal for plant growth.
2. It helps in medical diagnosis.
3. It helps to maintain correct acid base balance in swimming pools.

## Q. How etching is used to crave patterns into metals. .

# CANTT ACADENY <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288 

Ans. Etching is an art that uses acid to crave patterns into metal, glass and other materials. In this process a piece of metal or glass is covered with wax. After this a design is etched on the plate. The plate is then dipped into a tank of acid. The acid eats away the exposed portion. As a result a design is left behind and then the plate is taken out of the acid tank and cleaned. If we want to get colourful
design then some ink is applied on etching.

## Q. What happens when we put lemon juice on fish?

Ans. The unpleasant fishy odour is due to amines. The citric acid present in lemon juice converts amines into non-volatile salts. As a result the unpleasant fishy odour reduces(decreases).

## Salts:-

An acid contain replaceable hydrogen atoms. When these hydrogen atoms are completely or partially replaced by a metal atom then a new compound is formed which is called salt.

Salts are ionic compounds. The first part of the name of salt is the name of metal ion and second part of the name is negative part of the acid.

NaCl

The name of metal ion (sodium)

Negative part of acid (chloride)

## Neutralization Reaction:-

The reaction of an acid with a base in which salt and water are formed is called neutralization reaction. It is basically a reaction $\mathrm{b} / \mathrm{w} \mathrm{H}^{+}$ions of acid and $\mathrm{OH}^{-}$ions of a base.

$$
\begin{array}{ll}
\text { Acid }+\mathrm{Base} \\
\mathrm{HCl}+\mathrm{NaOH} & \longrightarrow \text { salt }+ \text { water } \\
\mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}
\end{array}
$$

Also

Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288

$$
\mathrm{H}^{+}+\mathrm{OH}^{-} \longrightarrow \mathrm{H}_{2} \mathrm{O}
$$

## Methods for Making Salts:-

## First Method:-

Reaction of an acid with a base produce salt and water.

## Second Method:-

Reaction of an acid with metal oxide produce salt and water.

$$
\begin{aligned}
\text { Acid }+ \text { Metal oxide } & \longrightarrow \text { salt }+ \text { water } \\
\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{CuO} & \longrightarrow \mathrm{CuSO}_{4}+\mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

## Third Method:-

Reaction of an acid with a metal produce salt and water.

$$
\begin{aligned}
\text { Acid }+ \text { Metal } & \longrightarrow \text { alt }+ \text { hydrogen } \\
2 \mathrm{HCl}+\mathrm{Mg} & \longrightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2}
\end{aligned}
$$

## Fourth Method:-

Reaction of an acid with metal carbonate produce salt, carbon dioxide and water.

$$
\begin{aligned}
\text { Acid }+ \text { Metal carbonate } & \longrightarrow \text { Salt }+ \text { carbondioxide }+ \text { water } \\
2 \mathrm{HCl}+\mathrm{CaCO}_{3} & \longrightarrow \mathrm{CaCl}_{2}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

## Fifth Method:-

Addition of a salt in a salt produces a new salt.

$$
\begin{aligned}
\text { salt }+ \text { salt } & \longrightarrow \text { salt } \\
\mathrm{AgNO}_{3}+\mathrm{NaCl} & \longrightarrow \mathrm{AgCl}+\mathrm{NaNO}_{3}
\end{aligned}
$$

## Uses of Salts:- OR Food Preservation:-

Food preservation keeps food from spoiling and allows it to be stored for along time. Ancient methods for preserving food include boiling, salting, drying fruits and vegetables etc. In modern world many preservatives are used to preserve food without these preservatives food would spoil
long time before it is used. Many salts such as sulphites and benzoates are being used as preservatives to preserve food.

## Types of Salts:-

There are three main types of salts.
i) Acid Salt
ii) Basic Salt
iii) Normal Salt

## i) Acid Salt:-

A salt which is formed by partial neutralization of an acid is called acid salt.
OR
A salt which is formed by partial neutralization of replaceable $\mathrm{H}^{+}$ions of an acid by a positive metal ion are called acid salts.

## Example:-

$$
\mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{KOH} \quad \longrightarrow \quad \mathrm{KHSO}_{4}+\mathrm{H}_{2} \mathrm{O}
$$

## ii) Basic Salt:-

A salt which is formed by the partial neutralization of a polyhydroxy base is called
basic salt.
Example:-

$$
\begin{aligned}
\mathrm{Zn}(\mathrm{OH})_{2}+\mathrm{HCl} & \longrightarrow \mathrm{Zn}(\mathrm{OH}) \mathrm{Cl}+\mathrm{H}_{2} \mathrm{O} \\
\mathrm{Al}(\mathrm{OH})_{3}+\mathrm{HCl} & \longrightarrow \mathrm{Al}(\mathrm{OH})_{2}+\mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

## Normal Salt:-

A salt which is formed by complete neutralization of an acid is called normal acid.

## Example:-

$$
\begin{array}{cl}
\mathrm{HCl}+\mathrm{KOH} & \longrightarrow \mathrm{KCl}+\mathrm{H}_{2} \mathrm{O} \\
\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} & \longrightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O}
\end{array}
$$

Page \# 37:-

## Self Assessment Exercise 10.5:-

1) Hydroxides such as $\mathrm{Mg}(\mathrm{OH})_{2}$ called milk of magnesia is used as antacid. It neutralizes excess stomach acid ( HCl ). Write complete and balanced chemical equation for this neutralization reaction.

Ans. $\quad 2 \mathrm{HCl}+\mathrm{Mg}(\mathrm{OH})_{2} \longrightarrow \mathrm{MgCl}_{2}+\mathrm{H}_{2} \mathrm{O}$
2) HCl and KOH react and produce potassium chloride. Write complete and balanced chemical equation for this neutralization reaction.

Ans.

$$
\mathrm{HCl}+\mathrm{KOH} \longrightarrow \mathrm{KCl}+\mathrm{H}_{2} \mathrm{O}
$$

3) Balance the following neutralization reaction.

Ans.

$$
\begin{aligned}
\mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} & \longrightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O} \\
\mathrm{H}_{3} \mathrm{PO}_{4}+3 \mathrm{NaOH} & \longrightarrow \mathrm{Na}_{3} \mathrm{PO}_{4}+3 \mathrm{H}_{2} \mathrm{O}
\end{aligned}
$$

Page \# 38:-

## Self Assessment Exercise 10.6:-

Q. Classify following salts as normal or acid salts.

1. $\mathrm{NaHSO}_{4}$

Ans. $\mathrm{NaHSO}_{4}$ is an acid salt.
3. $\mathrm{KHCO}_{3}$

Ans. $\mathrm{KHCO}_{3}$ is an acid salt.
2. $\mathrm{Na}_{2} \mathrm{SO}_{4}$

Ans. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ is a normal salt.
4. $\mathrm{K}_{2} \mathrm{CO}_{3}$

Ans. $\mathrm{K}_{2} \mathrm{CO}_{3}$ is an normal salt.

## Page-No-51

## Exercise Question

Write the equation for the self-ionization of water
Ans:- Self- Ionization of Water:-
The reaction in which two water molecules produce ions is called as the self ionization or auto-ionization of water.

$$
\mathrm{H}_{2} \mathrm{O} \rightleftharpoons \mathrm{H}^{+}+\mathrm{OH}^{-}
$$

# CANTT ACADENY <br> Main Tahli Mohri Chowk Tulsa Road Lalazar Rwp Ph: 051-5564779, Cell: 0321-5138288 

A water molecule that donate or lose a proton becomes a negatively charged hydroxide ion $\left(\mathrm{OH}^{-}\right.$ ).and the water molecule which gains or accepts the protons becomes positively charged hydronium ion $\left(\mathrm{H}_{3} \mathrm{O}^{+}\right)$

$$
\mathrm{H}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{OH}^{-}
$$

## Q-No-2(ii)

## Define and give example of Arrhenius acids.

## Ans:- Arrhenius Acids:-

According to Arrhenius concept an acid is a substance that ionizes in water to produce $\mathrm{H}^{+}$ ions.

Examples:-
$\begin{array}{lll}\text { i. } & \mathrm{HCl} \\ \text { i. } & \mathrm{HNO}_{3} & \stackrel{\mathrm{H}_{2} \mathrm{O}}{\rightleftharpoons \stackrel{\mathrm{H}_{2} \mathrm{O}}{\rightleftharpoons}}\end{array} \mathrm{H}^{+}+\mathrm{Cl}^{-} \mathrm{H} \mathrm{H}_{2} \mathrm{O} 30+2 O_{3}^{-}$
ii. $\mathrm{CH}_{3} \mathrm{COOH} \stackrel{\mathrm{H}_{2} \mathrm{O}_{3}}{\rightleftharpoons} \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+}$

## Q-No-2(iii)

## Why $\mathbf{H}^{+}$acts as a Lewis acid?

Ans:- According to Lewis concept an acid is a substance that can accept a pair of electrons to from a coordinate covalent bond. Since $\mathrm{H}^{+}$ion has no electrons so it can easily accept a pair of electron from another atom. That is why $\mathrm{H}^{+}$ion acts as a Lewis acid.

# CANT T ACADEMY <br> Main Tali Mohri Chowk Tulsa Road Lalazar Rp Ph: 051-5564779, Cell: 0321-5138288 

Ans:- According to Bronsted- Lowery concept an acid is a proton donor and a base is a proton acceptor. Ammonia $\left(\mathrm{NH}_{3}\right)$ is a gas at room temperature when it is dissolved in water then following reaction occurs.

$$
\mathrm{NH}_{3}=\mathrm{H} \times \bullet \stackrel{\bullet}{\mathrm{N}} \cdot \times \mathrm{H}
$$

00

H

And

And

Overall reaction is:
$\mathrm{H}-\mathrm{N}-\mathrm{H}$
$+$
H

H

H
H
$\square$
$\mathrm{H}_{2} \mathrm{O}=\mathrm{H}$
$\stackrel{\circ}{\mathrm{O}}$ :
H

In this water $\left(\mathrm{H}_{2} \mathrm{O}\right)$ is proton donor and ammonia $\left(\mathrm{NH}_{3}\right)$ proton acceptor. Therefore according to Bronsted-Lowry concept water acts as an acid and ammonia acts as base.

## Q-No-2(v)

## Why $\mathrm{BF}_{3}$ acts as Lewis acid?

Ans:- According to Lewis concept an acid is $\nless x$ substancexhat can accept a pair of electrons to form a coordinate covalent bond and base is a substance that can donate a pair of electrons to form a coordinate covalent bond.

$$
\begin{aligned}
& \mathrm{BF}_{3}=
\end{aligned}
$$

Boron is $\mathrm{BF}_{3}$ has six electrons (3 electron pair). So it needs two more electrons (an electron pair) to complete its Octet. Therefore $\mathrm{BF}_{3}$ is an electron pair acceptor. Hence according to Lewis concept $\mathrm{BF}_{3}$ is Lewis acid.

$$
\mathrm{NH}_{4} \mathrm{OH}+\mathrm{HNO}_{3} \quad \text { Q-No-3 } \quad \mathrm{NH}_{4} \mathrm{NO}_{3}+\mathrm{H}_{2} \mathrm{O}
$$

$$
\begin{array}{llll} 
& & \text { Q-No-4 } & \\
\text { i. } & \mathrm{H}_{2} \mathrm{SO}_{4}+\mathrm{Mg}(\mathrm{OH})_{2} & & \mathrm{MgSO}_{4}+2 \mathrm{H}_{2} \mathrm{O} \\
\text { ii. } & \mathrm{H}_{2} \mathrm{SO}_{4}+2 \mathrm{NaOH} & \longrightarrow & \mathrm{Na}_{2} \mathrm{SO}_{4}+2 \mathrm{H}_{2} \mathrm{O} \\
\text { iii. } & 2 \mathrm{HCl}+\mathrm{Ca}(\mathrm{OH})_{2} & \longrightarrow & \mathrm{CaCl}_{2}+2 \mathrm{H}_{2} \mathrm{O}
\end{array}
$$

Q-No-5
i. $\quad \mathrm{HNO}_{3}+\mathrm{H}_{2} \mathrm{O}$
$\longrightarrow$
$\mathrm{H}_{3} \mathrm{O}^{+}+\mathrm{NO}_{3}^{-}$

According to Bronsted - Lowry concept an acid is a proton donor and base is a proton acceptor. In the above reaction $\mathrm{HNO}_{3}$ is converted into $\mathrm{NO}_{3}$ by donating a proton therefore $\mathrm{HNO}_{3}$ is an acid and $\mathrm{H}_{2} \mathrm{O}$ accepts the proton so it is a base.

$$
\text { ii. } \mathrm{NH}_{3}+\mathrm{HNO}_{3} \quad \longrightarrow \quad \mathrm{NH}_{4} \mathrm{NO}_{3}
$$

In this reaction $\mathrm{HNO}_{3}$ donates a proton to $\mathrm{NH}_{3}$ so $\mathrm{HNO}_{3}$ is an acid and $\mathrm{NH}_{3}$ accepts this proton so $\mathrm{NH}_{3}$ is a base.

## Q-No-6

i. $\mathrm{F}+\mathrm{BF}_{3} \longrightarrow\left[\mathrm{BF}_{4}\right]$

According to Lewis concept an acid is a substance that can accept a pair of electrons to form a coordinate covalent bond and base is a substance that can donate a pair of electrons to form a coordinate covalent bond.

In this above reaction F has a lone pair so it can donate a lone pair of electrons. Therefore it is Lewis base. Whereas in $\mathrm{BF}_{3}$ Boron has six electrons and it needs two more electrons to complete its octet. Therefore $\mathrm{BF}_{3}$ is an electron pair acceptor. Hence according to Lewis concept $\mathrm{BF}_{3}$ is lewis acid.
ii. $\mathrm{H}+\mathrm{NH}_{3} \longrightarrow\left[\mathrm{NH}_{4}\right]$
$\mathrm{H}^{+}$ion has no electrons so it can accept a lone pair of electrons from another atom.
Therefore according to Lewis concept $\mathrm{H}^{+}$ion acts as Lewis acid. Whereas $\mathrm{NH}_{3}$ has a lone pair of Nitrogen atom so it can donate an electron pair. Therefore $\mathrm{NH}_{3}$ is Lewis base.
iii. $\mathrm{NH}_{3}+\mathrm{AlCl}_{3} \longrightarrow\left[\mathrm{H}_{3} \mathrm{~N}-\mathrm{AlCl}_{3}\right]$

In the above reaction Aluminium $(\mathrm{Al})$ in $\mathrm{AlCl}_{3}$ has six electrons and it needs two more electrons to complete its octet. Therefore $\mathrm{AlCl}_{3}$ is an electron pair of acceptor so it is Lewis acid and $\mathrm{NH}_{3}$ contains a lone pair so it can donate this lone pair. Hence $\mathrm{NH}_{3}$ is Lewis base.

## Q-No-7

i. $\quad\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-3} \mathrm{M}$

Here $\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-3} \mathrm{M}>1.0 \times 10^{-7} \mathrm{M}$
Therefore given solution is acidic.
ii. $\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-10} \mathrm{M}$

Here $\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-10} \mathrm{M}<1.0 \times 10^{-7} \mathrm{M}$
Therefore given solution is basic.
iii. $\left[\mathrm{OH}^{-}\right]=1.0 \times 10^{-3} \mathrm{M}$

First all we will find concentration of $\mathrm{H}^{+}$ion

$$
\left[\mathrm{H}^{+}\right]=\text {? }
$$

We know that

$$
\begin{aligned}
& \mathrm{K}_{\mathrm{w}}=\left[\mathrm{H}^{+}\right][\mathrm{OH}] \quad \text { Here } \mathrm{K}_{\mathrm{w}}=1.0 \times 10^{-14} \mathrm{M} \\
& 1.0 \times 10^{-14}=\left[\mathrm{H}^{+}\right]\left[1.0 \times 10^{-3}\right] \\
& \frac{1.0}{1.0} \frac{\times 10^{-14}}{10-3}=\left[\mathrm{H}^{+}\right] \\
& \quad\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-11} \mathrm{M}
\end{aligned}
$$

Here

$$
\left[\mathrm{H}^{+}\right]=1.0 \times 10^{-11} \mathrm{M}<1.0 \times 10^{-7} \mathrm{M}
$$

Therefore given solution is basic.

Q -No -8

## i. $\quad \mathrm{NH}_{3}$ <br> $$
\mathrm{NH}_{3}=\mathrm{H} \times \stackrel{\stackrel{\bullet}{\mathrm{N}}}{\substack{\mathrm{~N} \\ \mathrm{H}}} \times \mathrm{H}
$$

Ammonia $\mathrm{NH}_{3}$ has a lone pair on Nitrogen atom so it can donate an electron pair. Therefore according to Lewis concept $\mathrm{NH}_{3}$ base.

## ii. $F$

F has a lone pair on Flourine atom so it can donate an electron pair. Therefore according to Lewis concept F is Lewis base.
